Congressional Record

PROCEEDINGS AND DEBATES OF THE 113th CONGRESS, FIRST SESSION

Vol. 159

WASHINGTON, MONDAY, OCTOBER 28, 2013

No. 151

Senate

NATIONAL CENTER FOR BIOTECHNOLOGY INFORMATION ANNIVERSARY

Mr. CARDIN. Mr. President, I rise to recognize the 25th anniversary of the National Center for Biotechnology Information—NCBI—part of the National Library of Medicine at the National Institutes of Health, America's world-renowned research institution in Bethesda, MD.

It is my honor to be joined by me with the "Open Science" champions of Change to create separate laws creating individual institutes at NIH. In 1987, while a Member of the House of Representatives and chairman of the Select Committee on Aging's Subcommittee on Health and Long-Term Care, Pepper introduced H.R. 393, the National Biotechnology Information Act, which established the NCBI. At a March 1987 hearing on H.R. 393, Pepper explained that "we are dealing with nothing less than the mystery of human life and the unfolding scroll of knowledge, seeking to penetrate that mystery, which is life itself." He noted that his bill was intended "to facilitate the development of advanced computer and communication systems that will make it possible for the vast expanding knowledge of the gene to be assimilated into a computer system and made available for distribution to researchers and to people generally all over the World."

Soon thereafter, Congress embraced the importance of the biotechnology field, recognized the pressing need to harness the large volume of data emanating from the genetic revolution in science, and endorsed the establishment of NCBI to manage this valuable resource for the benefit of human health. With strong bipartisan support in Congress, Pepper's bill was enacted as part of Senator Ted Kennedy's comprehensive measure, the Health Omnibus Extension Programs of 1988, on November 4, 1988.

Today, biomedical research encompassing genomic and genetic knowledge is a major driver

of medical progress. The foresight of Congress in establishing the NCBI, combined with the innovative leadership of Director Dr. David Lipman and the expertise of the agency's dedicated staff, has led to the emergence of an impressive national resource for molecular biology information. In June of this year, Dr. Lipman was honored by me with the "Open Science" champions of Change award for his work at NCBI. By organizing and integrating genomic data for developing diagnostic and clinical applications, the Center serves as a bridge from research to the medical community. Each day, more than 3 million users access NCBI's 40 interlinked genomic and bibliographic databases and download more than 30 terabytes of data.

I am proud that Congress has continued to support funding for the NCBI over the past 25 years. Recently, by requiring that the results of NIH-funded research be made public through the Center's PubMed Central Database, Congress has opened to everyone the full text of published journal articles that are essential to advancing scientific research and public health.

The biomedical research funded by the NIH provides knowledge essential to combat debilitating diseases, and continuing this research is dependent on the resources and tools that NCBI has developed so successfully for the benefit of the biomedical community. As NIH Director Francis Collins has noted, we are entering an era of precision medicine in which a patient's genetic makeup may determine the exact treatment that is provided. Surely, the NCBI databases and tools will be needed on the front lines of this new effort.

On the occasion of this 25th anniversary, I ask my colleagues to join me in congratulating Dr. Lipman and the outstanding staff of NCBI, who through their skill and vision have built this unique biomedical resource.

August 1997

Vice President Launches PubMed, Lauds Free MEDLINE Access

"MEDLINE...will henceforth be available free to the American people." With those words, Vice President Al Gore inaugurated the PubMed search system at a Capitol Hill press conference on June 26. PubMed, which provides Web access to the National Library of Medicine's (NLM) database of the biomedical journal literature, MEDLINE, was heralded by Senator Tom Harkin (IA) as "the model of a smart, creative government initiative." The Vice President viewed free access to MEDLINE as consistent with the Clinton administration's

other "empowerment" initiatives stating, "This development...may do more to reform and improve the quality of health care in the United States than anything else we've done in a long time."

Searching PubMed

PubMed grew out of NCBI's Entrez project which, since 1992, has offered a subset of MEDLINE records related to molecular biology. In addition to encompassing all of MEDLINE and PreMEDLINE, PubMed retains Entrez's ability to use one article as a "seed" to find other similar

articles. By traversing the **See Related Articles** links, a user can find articles similar in concept with speed and precision. PubMed expands upon Entrez by linking MEDLINE articles to full-text Web sites maintained by publishers. Currently, 95 journals are linked to PubMed, including Cell, Journal of Biological Chemistry, Journal of Cell Biology, New England Journal of Medicine, and Science. Access to full-text Web sites may require subscriptions or registration.

PubMed Options

PubMed offers the option to search MEDLINE or any of NCBI's molecular biology databases. Users can select from a variety of search fields, including but not limited to: text words, author names, and journal titles. A MEDLINE citation for which there is a corresponding online, full-text article will have a button at the top of the abstract page that links to the publisher's Web site. Additional links point to

国际期刊对数据递交的要求

Distribution of Materials and Data

One of the terms and conditions of publishing with Cell Press is that authors be willing to distribute any materials and protocols used in the published experiments to qualified researchers for their own use. Materials include but are not limited to cells, DNA, antibodies, reagents, organisms, and mouse strains or, if necessary, the relevant ES cells. These must be made available with minimal restrictions and in a timely manner, but it is acceptable to request reasonable payment to cover the cost of maintenance and transport of materials. If there are restrictions to the availability of any materials, data, or information, these must be disclosed in the cover letter and in the STAR Methods section of the manuscript at the time of submission.

Data sets must be made freely available to readers from the date of publication and must be provided to editors and peer reviewers at submission for the purposes of evaluating the manuscript. In addition, we offer the opportunity for authors to make underlying data not included in the paper itself or deposited in a database available to the scientific community by posting them on [Mendeley Data](#) and then including a link in the published paper. For more detailed instructions, [click here](#).

For the following types of data, submission of the full data set to a community-endorsed, public repository is mandatory. Accession numbers must be provided in the paper (see "Database Linking" below for specific formatting instructions). Examples of appropriate public repositories are listed below.

DNA and Protein Sequences

Protein Sequences: [Uniprot](#)

DNA and RNA Sequences: [Genbank/European Nucleotide Archive \(ENA\)/DDBJ, Protein DataBank, UniProt](#)

DNA Sequencing Data (traces and short reads): [NCBI Trace and Short-Read Archive, ENA's Sequence Read Archive](#)

Deep Sequencing Data: Deposit in [GEO](#) or [ArrayExpress](#) upon submission to the journal

The sequences of all RNAi, antisense, and morpholino probes must be included in the paper or deposited in a public database with the accession number provided in the paper.

NIH Genomic Data Sharing Policy

Genomic research advances our understanding of factors that influence health and disease, and sharing genomic data provides opportunities to accelerate that research through the power of combining large and information-rich datasets. To promote robust sharing of human and non-human data from a wide range of genomic research and to provide appropriate protections for research involving human data, the National Institutes of Health (NIH) issued the *NIH Genomic Data Sharing Policy* (GDS Policy) on August 27, 2014 in the *NIH Guide Grants and Contracts* (available at <http://grants.nih.gov/grants/guide/notice-files/NOT-OD-14-124.html>), and in the *Federal Register* (available at <https://federalregister.gov/a/2014-20385>) on August 28, 2014. The GDS Policy and related documents are available at:

- [Preamble to the NIH GDS Policy](#)

NIH要求及时公开被资助项目产出的数据

National Institutes of Health Genomic Data Sharing Policy

B. Non-human Genomic Data

1. Data Submission Expectations and Timeline

Large-scale non-human genomic data, including data from microbes, microbiomes, and model organisms, as well as relevant associated data (e.g., phenotype and exposure data), are to be shared in a timely manner. Genomic data undergo different levels of data processing, which provides the basis for NIH's expectations for data submission. These expectations are provided in the Supplemental Information. **In general, investigators should make non-human genomic data publicly available no later than the date of initial publication.** However, earlier availability (i.e., before publication) may be expected for certain data or IC-funded projects (e.g., data from projects with broad utility as a resource for the scientific community such as microbial population-based genomic studies).

2. Data Repositories

Non-human data may be made available through any widely used data repository, whether NIH-funded or not, such as the Gene Expression Omnibus (GEO)¹³ Sequence Read Archive (SRA),¹⁴ Trace Archive,¹⁵ Array Express,¹⁶ Mouse Genome Informatics (MGI),¹⁷ WormBase,¹⁸ the Zebrafish Model Organism Database (ZFIN),¹⁹ GenBank,²⁰ European Nucleotide Archive (ENA),²¹ or DNA Data Bank of Japan (DDBJ).²² NIH expects investigators to continue submitting data types to the same repositories that they submitted the data to before the effective date of the GDS Policy (e.g., DNA sequence data to GenBank/ENA/DDBJ, expression data to GEO or Array Express). Data types not previously submitted to any repositories may be submitted to these or other widely used repositories as agreed to by the funding IC.

DAVID J. LIPMAN, M.D.
Professor

Dr. David Lipman is the Director NCBI, USA, since 1989. He has overseen its growth into one of the most heavily used resources in the world for the search and retrieval of biomedical information. He is one of the developers of BLAST algorithm for fast sequence comparison. Dr. Lipman is the recipient of numerous awards, and is a member of the National Academy of Sciences, the Institute of Medicine, and the American Academy of Arts and Sciences.

NCBI Farewell

Lipman, David (NIH/NLM/NCBI) [E]

To: NLM/NCBI List ncbi

Wednesday, May 03, 2017 10:16 AM

"How lucky I am to have something that makes saying goodbye so hard." ~

Dear NCBI Colleagues,

After almost 30 years at NCBI, the time has come for me to say goodbye. I'll be leaving later this month to join an old friend, Pat Brown, at his company, Impossible Foods, as Chief Science Officer.

The reorganization efforts we started here last Fall have been successful - Kim, Bart, Fitz, & Al are a great team and David Landsman will continue heading up CBB. Dr. Patti Brennan has asked Jim Ostell to be the Acting Director and she gives him her fullest support as does the NIH Director, Dr. Francis Collins.

So I know I'm leaving NCBI as strong as it has ever been.

I hope you know by now how much I've appreciated working with all of you. We've done amazing things together and I expect greatness from you after I'm gone. Before leaving, I'll make the rounds to chat with as many of you as I can.

Thank you for being such an important part of my life...

• David

Phasing out support for non-human genome organism data in dbSNP and dbVar

May 9, 2017

☆☆☆☆ 29 Votes

This blog post is directed toward people who use dbSNP and dbVar, particularly those who submit non-human data to the two databases.

dbSNP and dbVar archive, process, display and report information related to germline and somatic variations from multiple species. These two databases have grown rapidly as sequencing and other discovery technologies have evolved, and now contain nearly two billion variants from over 360 species.

Based on projected growth and the resources required to archive and distribute the data, continued support for all organisms will become unsustainable for NCBI in the near future. Therefore, NCBI will phase out support for all non-human organisms in dbSNP and dbVar, and will support only human variation.

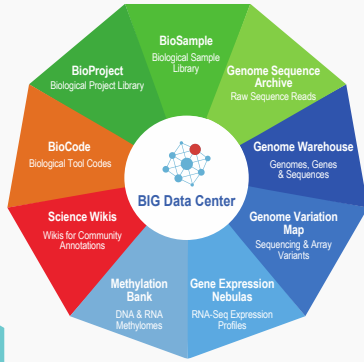

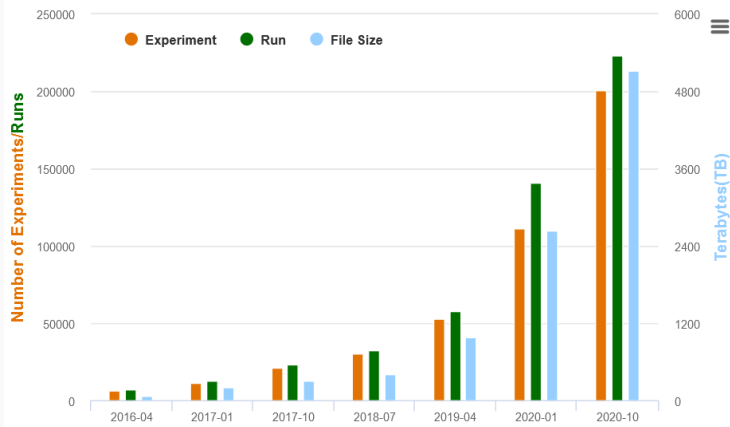

NCBI will phase out support for non-human organisms in dbSNP and dbVar following this timeline:

- September 1, 2017** – dbSNP and dbVar stop accepting non-human variant data submissions
- November 1, 2017** – dbSNP and dbVar interactive websites and related NCBI services stop presenting non-human variant data. The data will, however, continue to be available for download on the dbSNP and dbVar FTP sites.

Any non-human data that is already in the databases or that is submitted before September 1, 2017 will continue to be available via the dbSNP and dbVar FTP download sites.

The 2018 *Nucleic Acids Research* database issue and the online molecular biology database collection

Daniel J. Rigden¹* and José M. Fernández²

¹Institute of Integrative Biology, University of Liverpool, Crown Street, Liverpool L69 7ZB, UK and ²Institut Curie, 25 rue d'Ulm, 75005 Paris, France

Received November 28, 2017; Editorial Decision November 29, 2017; Accepted November 29, 2017

ABSTRACT

The 2018 *Nucleic Acids Research* Database Issue contains 181 papers spanning molecular biology. Among them, 82 are new and 84 are updates describing resources that appeared in the Issue previously. The remaining 15 cover databases most recently published elsewhere. Databases in the area of nucleic acids include 3DIV for visualisation of data on genome 3D structure and RNArchitecture, a hierarchical classification of RNA families. Protein databases include the established SMART, ELM and MEROPS while GPCRdb and the newcomer STRDab cover families of biomedical interest. In the area of metabolism, HMDB and Reactome both report new features while PULDB appears in NAR for the first time. This issue also contains reports on genomics resources including Ensembl, the UCSC Genome Browser and ENCODE. Update papers from the IUPHAR/BPS Guide to Pharmacology and DrugBank are highlights of the drug and drug target section while a number of proteomics databases including proteomicsDB are also covered. The entire Database Issue is freely available online on the *Nucleic Acids Research* website (<https://academic.oup.com/nar>). The NAR online Molecular Biology Database Collection has been updated, reviewing 138 entries, adding 88 new resources and eliminating 47 discontinued URLs, bringing the current total to 1737 databases. It is available at <http://www.oxfordjournals.org/nar/database/>.

NEW AND UPDATED DATABASES

This 2018 *Nucleic Acids Research* Database Issue is the 25th annual collection of bioinformatic databases. The quarter century arrives with 181 papers which, as ever, span all areas of molecular biology research. The total includes 82 new databases (Table 1) and 84 updates of resources that have previously appeared in the Database Issue. There are also 15

updates on databases previously described elsewhere (Table 2).

As in previous years, databases are grouped into eight broad subject categories. These cover (i) nucleic acid sequence and structure, transcriptional regulation; (ii) protein sequence and structure; (iii) metabolic and signalling pathways, enzymes and networks; (iv) genomics of viruses, bacteria, protozoa and fungi; (v) genomics of human and model organisms plus comparative genomics; (vi) human genomic variation, diseases and drugs; (vii) plants and (viii) other topics, such as proteomics databases. In an era of increasingly interdisciplinary research, it is no surprise that the content of many databases spans multiple categories so that resources often do not sit comfortably in a single category. Readers are again urged to browse the whole issue, rather than confining themselves to the most obviously relevant sections. The *Nucleic Acids Research* online Molecular Biology Database Collection, which is available at <http://www.oxfordjournals.org/nar/database/>, retains its more finely grained organisation, encompassing 15

The issue begins with broad surveys of resources at major global centres, including the U.S. National Center for Biotechnology Information (NCBI), the European Bioinformatics Institute (EBI) and the BIG Data Center at the Beijing Institute of Genomics, Chinese Academy of Sciences. The NCBI Resources paper (1) presents an interest-

different databases within the site, exemplifying the value to the user of the extensive data integration implemented at these centres. The EBI paper (2) describes new data types including image data, biobanks and biosamples, as well as charting the continued exponential growth in the volume of many kinds of data. The newest of the three, the BIG Data Center (3), focuses on genomic information, but also hosts facilities for samples, program code, and wikis. Many of the wikis are very active and have previously featured in NAR eg IncRNAwiki (4).

The 'Nucleic acid databases' section begins with updates from the International Nucleotide Sequence Database Collaboration (5) and its three contributors, GenBank, ENA and DDBJ (6–8) which together face the challenge of con-

The issue begins with broad surveys of resources at major global centres, including the U.S. National Center for Biotechnology Information (NCBI), the European Bioinformatics Institute (EBI) and the BIG Data Center at the Beijing Institute of Genomics, Chinese Academy of Sciences. The NCBI Resources paper (1) presents an interest-

- 2017 年在 *Nucleic Acids Research* 发表 1 篇论文
- 2018 年在 *Nucleic Acids Research* 发表 4 篇研究成果
- 2019 年在 *Nucleic Acids Research* 发表 7 篇研究成果

共建“国家基因组科学数据中心” - NGDC

中国科学院北京基因组研究所

国家基因组科学数据中心

中国科学院北京基因组研究所

科学技术部
财政部 文件

国科发基〔2019〕194号

科技部 财政部关于
发布国家科技资源共享服务平台优化
调整名单的通知

教育部、自然资源部、农业农村部、卫生健康委、市场监管总局、林草局、中科院、地震局、气象局、药监局科技、财务主管部门，广东省科技厅、财政厅：

为落实《科学数据管理办法》和《国家科技资源共享服务平台管理办法》的要求，规范管理国家科技资源共享服务平台（简称国家平台），完善科技资源共享服务体系，推动科技资源向社会开放共享，科技部、财政部对原有国家平台开展了优化调整工作，通过部门推荐和专家咨询，经研究共形成“国家高能物理科学数据

国家科技资源共享服务平台名单

国家平台名称	依托单位	主管部门
国家高能物理科学数据中心	中国科学院高能物理研究所	中科院
国家基因组科学数据中心	中国科学院北京基因组研究所	中科院
国家微生物科学数据中心	中国科学院微生物研究所	中科院
国家空间科学数据中心	中国科学院国家空间科学中心	中科院
国家天文科学数据中心	中国科学院国家天文台	中科院
国家对地观测科学数据中心	中国科学院遥感与数字地球研究所	中科院
国家极地科学数据中心	中国极地研究中心	自然资源部
国家青藏高原科学数据中心	中国科学院青藏高原研究所	中科院
国家生态科学数据中心	中国科学院地理科学与资源研究所	中科院
国家材料腐蚀与防护科学数据中心	北京科技大学	教育部
国家冰川冻土沙漠科学数据中心	中国科学院寒区旱区环境与工程研究所	中科院
国家计算科学数据中心	中国科学院研究院	市场监管总局
国家地球系统科学数据中心	中国科学院地理科学与资源研究所	中科院

— 3 —

2019.6.5，科技部、财政部联合发布，依托中国科学院北京基因组研究所，成立“国家基因组科学数据中心”

建立“国家生物信息中心”

2019.11.13，中央编办批复：经研究并报中央编委批准，同意中国科学院北京基因组研究所加挂“国家生物信息中心”牌子

2019新型冠状病毒信息库 (2019nCoV)

2020年1月22日上线，提供全球数据整合、冗余去除、质量评估、序列下载、动态监控等

六大模块

2019新型冠状病毒序列
(138393 条)

冠状病毒序列
(391258 条)

基因组变异
(18721 个)

智能诊断 & 在线工具

临床信息
(208 条)

文献情报
(72140 篇)

<https://bigd.big.ac.cn/ncov>

服务全球

截至2020年10月2日，已收录全球**138,393**条新冠病毒基因组序列信息，为全球**175**个国家/地区**17**万余访客提供数据服务，累计数据下载**1.48**亿多条，国外访客占比高达**60%**

谢谢！
